Common failures

Unexpected breakdowns can cost you time and money. This section highlights the most common issues for this make, model, and year of vehicle, together with the symptoms to look out for when test driving it.

Common breakdown reasons

1. Battery

Symptoms include: engine won't / is slow to turn over, clicking noise when ignition turned to start position, dim / no lights on instrument panel, corrosion around battery terminals.
TIP: If engine won't turn over properly ask to jump start & test the battery.

2. Alternator

Symptoms include: a discharged battery, ignition warning light on / dim with engine running.
TIP: Check that the battery/ignition warning light goes out after starting the engine, check alternator drive belt where possible.

3. Electrical systems

Symptoms include: electrical functions aren't working correctly.
TIP: Check all electrical functions operate including wipers, washers, horn, electric windows, sunroof, audio system, seat controls etc. Check any switch operated boot or fuel filler flap release.

4. Transmission system

Symptoms include: excessive noise, difficulty selecting gears, knocking noise on cornering, oil leaks from transmission unit or difficult gear selection.
TIP: Check for smooth gear changes, listen out for unusual / 'whining' sounds from the transmission. Ask a qualified mechanic to check concerns with auto gearboxes.

5. Engine system

Symptoms include: abnormal noise, leaks, uneven running, lack of power, smoky exhaust fumes.
TIP: Check oil level & contamination – whitish oil on dipstick could indicate head gasket problems. Blue smoke indicates oil burning suggesting engine wear or damage.

6. Cooling system

Symptoms include: high temperature gauge reading / temperature not rising as engine warms up, heater cold after running engine, contaminated coolant.
TIP: Check coolant level, look for coolant leaks in engine bay & beneath engine, inspect hoses for excessive wear / cracks.

Common MOT failures

1. Braking system operation

Failure areas: poor operation, brake pads binding to disc, uneven braking or poor braking response.
TIP: Check the handbrake operates from a hill start. The car shouldn't pull to the right / left when operating the brake pedal.

2. Braking system condition

Failure areas: excessively worn brakes, seized / insecure parts, leaking / contaminated fluid, uneven / poor braking.
TIP: Check the car doesn't pull to the right / left when operating the brake pedal.

3. Suspension system condition

Failure areas: leaking fluid, damaged / defective parts, reduced functionality, insecure / missing / seized parts, excessive wear or inappropriate modifications.
TIP: Push down on each corner of the car, the car should rise back up and not continue to bounce. Watch out for 'rolling' when driving around corners.

4. Exhaust system

Failure areas: insecure exhaust / pipes, leaking fluid, excessive smoke / emissions.
TIP: Rattles could indicate a loose exhaust system.

5. Lighting systems

Failure areas: an inoperative / defective light, misaligned beams or insecure parts.
TIP: Check that all lights and indicators are working. To check alignment, park the car facing a wall and ensure beams are level.

6. Steering system condition

Failure areas: excessive wear, corrosion, leaking fluid, damage to steering system or insecure parts.
TIP: Check for leaks from the power steering reservoir.

7. Braking system

Symptoms include: low brake fluid level, excessively hard / spongy brake pedal, parking brake not holding, car pulls to one side / judders when braking.
TIP: Be aware of vibrations from brake pedal / steering wheel when braking. Ask a qualified mechanic to check any brake concerns.

8. Alarm & immobiliser

Symptoms include: alarm won't set / deactivate, engine doesn't start, engine cuts out, remote locking not working.
TIP: Press fob button(s) & check locks operate, engine should start ok, test alarm function.

9. Body

Symptoms include: bonnet / boot won't open / close properly, door locks not working properly, panel damage.
TIP: Check paint shading on different panels & any odd gaps between panels – these may indicate an accident repair / re-spray.

10. Clutch system

Symptoms include: clutch slippage / lack of power, difficult gear selection, car judders when pulling away, abnormal noise or stiff pedal.
TIP: Check the biting point is midway on the pedal. Unusual smells could indicate a slipping clutch, stiff pedal may indicate a cable fault.
